

Mohammad Haider

Software Engineer | Data platforms, pipelines & data quality

hi@mhaider.dev | mhaider.dev | github.com/haidmoham | linkedin.com/in/haidmoham

SUMMARY

Software engineer with three years at Microsoft and subsequent BI development at the University of Virginia. Experience in data-model migrations, pipeline verification, cross-system reconciliation, and SQL-backed analytics; independent work includes a Python/DuckDB/dbt data application.

PROFESSIONAL EXPERIENCE

University of Virginia | Charlottesville, VA

IT Analyst Intermediate, BI Developer

May 2025 - Mar 2026

- Delivered SQL-backed Tableau products from stakeholder interviews through deployment and maintenance, translating ambiguous operational questions into shared metric definitions.
- Reconciled purchase-order states across financial systems and built reporting that surfaced discrepancies and their financial impact.
- Collaborated on telemetry-informed optimization that reduced organization-wide dashboard load times by approximately 20%.
- Built environmental and economic-impact reporting for the ReUSE Store and adapted Tableau views as operational workflows changed.

Microsoft | Redmond, WA

Software Engineer I

Jul 2021 - Jul 2024

- Owned an SSAS Multidimensional-to-Tabular migration; defined parity checks, monitored four weeks of pipeline behavior, and kept the legacy service available until cutover criteria were met.
- Wrote and deployed Azure Data Factory verification scripts for daily pipeline monitoring and legacy-to-Tabular data consistency.
- Validated downstream reporting workflows showing up to 200x faster filtering and approximately 4x faster Excel loading.
- Built a full-stack C#.NET prototype that guided configuration, generated configuration files, and validated output.

Microsoft | Redmond, WA

Software Engineering Intern

Summers 2017, 2018

- Built a C# service that identified each OneDrive user's most recently used items for a product UI feature; validated the service in development.

SELECTED INDEPENDENT PROJECTS

Indigo Circuit | Python, DuckDB, dbt, Flask

indigocircuit.app

- Built a tournament-data application with nightly Python/DuckDB/dbt processing and Glicko-2 player ratings.
- Added validation gates for shadow-database rebuilds before promotion, with a direct-write fallback.
- Implemented Bayesian shrinkage for experimental deck estimates, with approximate 90% model intervals and documented uncertainty limits.

LM Lab | Python, PyTorch, Jupyter

github.com/haidmoham/lmlab

- Preserved source hashes and model/optimizer/RNG checkpoints, with restoration checks that reproduced subsequent updates.

TECHNICAL SKILLS

Languages: SQL, Python, C#, R

Production systems: Azure Data Factory, SSAS Tabular, Azure Synapse, Kusto (KQL), Tableau, C#.NET

Independent projects: DuckDB, dbt, pandas, NumPy, Flask, PyTorch; Git, GitHub Actions

EDUCATION

Virginia Tech | B.S. in Statistics

2021
